

## LED Upgrade Installation

\*\*\*Always turn off power and gas before performing work on the range\*\*\*

The image below is a fragmented view of all the parts necessary for the new LED installation, and all parts completed. Be sure to replace one LED at a time as not to confuse the location of each LED.

1. Carefully remove each wire connector from the back of the old LED. You will need to remove the plastic insulator from the ends of each wire by prying open the clip with a small flathead screwdriver (or pinching the exterior of the plastic insulator with a pair of pliers near the internal tab clip) then pull the insulator off the spade connector.

2. Insert each spade connector into the clear plastic Heyco H-block connector like shown.

3. Remove the old LED by pushing it through the control panel from the rear. Thread the LED + wires into the broad end of the metal bezel and snap it into place (until the lens is flush). Attach the mini insulator clips on the LED wire ends and then thread both wires through the hole in the control panel one at a time.

4. Shove the metal bezel through the hole. If the hole seems too small or tight, push on the bezel firmly while making a circular motion with your thumb, causing the bezel to gyrate. This should slowly enlarge the hole by gently scraping enamel material from the inside edge of the hole to allow the LED bezel to be fully inserted.

5. Thread the wire ends through the circular retainer clip with the teeth on the clip pointed towards the wire ends like shown. While backstopping the front of the LED lens to firmly hold it against the control panel surface, incrementally slide the retainer clip over the bezel until firmly seated to the control panel.

6. Place the LED wire ends into the Heyco connector and seat them fully into place using a thin blunt tool like the end of a screwdriver. Note: Since polarity is not an issue, the position of each LED wire can be positioned in either side of the connector.

7. Pull the silicone sheathing over the Heyco connector and repeat this process on the remaining LEDs.
